

A guide · The $500 trillion PPP infrastructure opportunity

Launch a PPP program for Blockchain Companies in Jordan

WHAT THIS GUIDE IS FOR

Your company launches a PPP program to tokenize public-private partnership (PPP) projects and to run the registries, smart contracts and investor onboarding behind them, starting with Jordan's $86 billion and Aqaba's $46 billion of projects.

INTRODUCTION

A century of infrastructure reaches the end of its useful life

Most of the roads, bridges, power plants, water networks, ports and airports the world runs on were built in the last hundred years, and much of that stock is wearing out at the same time.

The infrastructure of the twentieth century was designed, poured and left to age. It carried the growth of every modern economy, and it was built for a world with fewer people, far less data and a different climate. Pipes leak, grids strain under new demand, and assets designed for one purpose are asked to carry several. Replacing them is the largest building program in human history, and it has already begun.

Rebuilding and running the world's infrastructure will take about $500 trillion over the next fifty years. It is the largest investment humanity will make in that time. Public-private partnerships (PPPs) will carry a large share of it, because governments cannot fund, build and run the rebuild alone, and the private sector cannot do it without them.

How the $500 trillion adds up

	$300T	to build the physical assets: roads, rail, ports, grids, water, cities, schools and hospitals
+	$150T	to operate and maintain them across the life of each concession
+	$50T	for the sensors, compute and robotics that will sit inside them, the share of the rebuild that venture capital can fund
=	$500T	**in total to rebuild and run the world's infrastructure over the next fifty years**

INTRODUCTION

The next hundred years will build Earth's largest computer

For thousands of years the method has stayed the same: design it, pour it, forget it, and repair it when it fails. The next generation of infrastructure will carry a software layer specified alongside the concrete. Assets will monitor their own condition, predict their own failures and schedule their own maintenance, and fleets of machines will raise them with very few human hands involved.

The larger change is the connection between assets. When a port knows what the rail line is carrying before it arrives, a water utility prices its pumping energy against the grid in real time, and every contract and drawing on every project sits in one connected record, the built world starts to behave as one system. Joined across borders, the world's roads, grids, ports, water networks, data centers and satellites become one globally connected, superintelligent computer.

Future infrastructure will be self-building, self-monitoring and self-healing. A road that senses its own cracks can schedule its own repair and use the savings to fund the next stretch. A water network that finds its own leaks can put the recovered water into meters on the next street. Each asset leaves behind the money, the data and the proof for the asset that follows it, so each new project starts further ahead than the last.

The point where the built world starts improving itself faster than anyone can direct it is the infrastructure singularity. Three technologies bring it closer: artificial intelligence designs and runs the assets, robotics builds and maintains them, and tokenization finances them and opens their ownership to everyone. Tokenization runs on blockchains, and it reaches into the other two, because every asset that AI runs and robots build produces data and revenue that a ledger can record and share.

Infrastructure has always been financed by a few banks and funds, and its ownership has stayed closed to almost everyone else. The projects of the next fifty years will be financed, recorded and owned on shared ledgers, and the companies that build those rails will run them for as long as the assets last. This guide invites blockchain companies in Jordan to launch a PPP program, starting with the projects at home.

THE GUIDE

Put the $500 trillion PPP infrastructure opportunity on chain

Your company opens a dedicated PPP program, a team and a set of products that tokenize PPP projects, record their contracts and performance on shared ledgers and pay their investors automatically, starting with Jordan's $86 billion of projects and the $46 billion anchored in Aqaba.

01 **A PPP tokenization team.** A dedicated team that knows how PPPs are prepared, procured and financed turns the company's platform into offers that contracting authorities, sponsors, lenders and investors can use, and it follows every project in Jordan's pipeline from the first market sounding.

02 **Tokenized PPP notes.** The company builds the issuance, investor onboarding, custody and revenue distribution behind tokenized participations in PPP loans and project revenues, with regulated banks and venues as partners, so a few hundred investors can fund a pilot and receive payments from the asset's own revenue.

03 **Shared project registries.** Contracts, milestones, payments and asset performance are recorded on a ledger that the government, the operator, the lenders and the investors all trust, so every party works from the same record.

04 **Blockchain-led direct proposals.** Jordan's PPP Law No. 19 of 2023 accepts direct private proposals under Article 15. The company can design a project around what a ledger makes possible, such as a tokenized solar or water pilot or a digital registry for a public service, and propose it to government with partners who finance and build it.

05 **Pilots as small-scale PPPs.** PPP Regulation No. 9 of 2024 defines small-scale PPPs below $14.1 million, which can be bundled into one feasibility report and one tender. A tokenized pilot at that scale gives the company a live issue, a reference and the data that larger concessions will ask for.

JORDAN AND AQABA

An $86 billion pipeline to start with

Jordan has 243 PPP and infrastructure projects in development, worth about $86 billion, of which $46 billion is anchored in Aqaba. Every one of them will need capital, records and payments that every party can trust.

$86 billion
of PPP and infrastructure projects in development across Jordan

$46 billion
anchored in Aqaba, Jordan's only port and its gateway to the Red Sea

SECTOR	PROJECTS	VALUE	WHAT THE PROJECTS WILL BUY
Energy	33	$28.3 billion	Grid and demand forecasting, solar and storage analytics, robotic panel cleaning, predictive maintenance
Tourism	40	$13.8 billion	Visitor flow and demand forecasting, resort and heritage-site operations, booking and payment rails
Urban development	17	$13.8 billion	Digital twins of new districts, digital permitting, modular construction, district operations
Transport	33	$11.7 billion	Traffic and fleet AI, tolling and payments, inspection drones for roads and rail
Industry	31	$8.1 billion	Factory automation, quality verification, industrial sensors and energy management
Water	29	$7.6 billion	Leak detection, pressure management, smart metering, pipe-inspection robots
Mining	15	$1.2 billion	Autonomous drilling and haulage, drone surveying, ore sorting
Health	12	$1.0 billion	Hospital operations AI, patient flow, equipment monitoring
Agriculture	10	$310 million	Precision irrigation, farm robotics, crop and soil monitoring
Environment	15	$270 million	Waste-sorting robotics, emissions monitoring, circular materials
Digital	6	$270 million	Data centers, connectivity, sovereign compute
Education	2	$20 million	School and training campus PPPs, digital learning, building operations and energy retrofits

A Jordanian company that tokenizes one project at home can carry the same platform to the next one across the region. Aqaba concentrates ports and terminals, logistics, rail to the port, industry, energy, water and tourism inside the Aqaba Special Economic Zone, which makes it a single place to test port automation, logistics software, desalination and energy technology on assets that connect Jordan to the world.

SECTOR GUIDES

Jordan's $86 billion, sector by sector

Jordan is investing in and advancing 23 sectors at once, and together their projects make up the $86 billion. A sector guide for each lists every project in it, its link to the infrastructure singularity and the ways a partner can take part.

The sectors closest to blockchain companies

Digital and AI	MoDEE and Blockexe launched the MODEE DLT national blockchain network on Sanad; Cabinet approved a blockchain policy. 19 projects, $243m of forward investment. www.JordanPPP.com/sectors/digital
Ports and Logistics	In 2019 Jordan Customs signed an MoU with Maersk GTD to pilot TradeLens, a blockchain platform for trade and port freight data. 23 projects, $3.6bn of forward investment. www.JordanPPP.com/sectors/logistics
Agriculture and Food	Jordan-based Decapolis raised $250,000 for its blockchain-powered food safety and traceability platform. 28 projects, $400m of forward investment. www.JordanPPP.com/sectors/agriculture

All 23 sector guides

Oil, Gas and Power	$15.1bn	Wastewater and Reuse	$946m
Tourism	$13.8bn	Nuclear Energy	$835m
Urban Development	$12.8bn	Agriculture and Food	$400m
Green Hydrogen	$10.6bn	Solar Power	$326m
Transport	$8.1bn	Digital and AI	$243m
Water	$6.7bn	Circular Economy	$189m
Fertilizers and Chemicals	$6.5bn	Wind Power	$186m
Ports and Logistics	$3.6bn	Pharmaceuticals	$128m
Manufacturing	$2.4bn	Creative Industries	$47m
Storage and Grids	$1.4bn	Defense	$10m
Mining and Minerals	$1.2bn	Education and Skills	$7m
Health	$986m		

Every sector guide can be read and downloaded at www.JordanPPP.com/sectors.

ARTIFICIAL INTELLIGENCE

AI designs, structures and runs it

A PPP takes about seven years from concept to financial close and costs roughly 10% of capex to structure. Almost all of that work is documents and models, which is the work AI does well.

What changes

When the cost of intelligence approaches zero, the cost of preparing a project falls with it. Feasibility studies, options appraisals, cost plans, risk matrices, financial models and tender documents can be produced and tested in days, and contracts can be drafted and stress-tested in hours. PPP projects will soon appoint an AI technical advisor alongside the human ones. Once an asset is running, the same intelligence operates it: a digital twin models the asset in real time, sensors report wear and faults early, and maintenance follows the data.

Jordan arrives late to PPP software, and that is an advantage. With few legacy systems to migrate off, AI-native tools can be built from the ground up, and the reasoning behind each decision can be captured inside the transactions being structured today.

What it means for blockchain companies

AI and blockchains work together inside a PPP. AI reads the contracts, models the revenues and monitors the asset, and a ledger records what it finds so the government, the lenders and the investors share one version of the truth. A blockchain company can link each payment on a tokenized note to the asset data that triggered it.

What will be built

Project preparation	Software that turns feasibility studies, cost plans and tender documents into a repeatable process, so the years spent before tender shrink to months.
Procurement	Tools that let ministries compare bids on whole-life cost and deliverability.
Cost estimation	A national benchmark database that prices every project against real Jordanian rates.
Contract intelligence	Assistants that read, compare and answer questions on every contract, drawing and instruction on a project in plain language.
Asset monitoring	Sensors and digital twins that tell an operator what will fail before it fails.
Permits and approvals	Digital workflows that replace the paper trail across ministries, municipalities and utilities.

ROBOTICS

Robots build it and keep it running

Most of the $500 trillion of infrastructure due over the next fifty years will be built by machines, and people will design, train and supervise those machines.

What changes

Autonomous software combined with autonomous machines produces autonomous infrastructure. Tunneling machines, construction robots, drones and modular factories already raise structures with far fewer people on site. The machines then stay with the asset: drones inspect bridges and power lines, robots travel inside pipes to find leaks, and cleaning robots keep solar fields at full output.

Robotics also changes who can compete. A small company with the right machines can build what once needed a thousand-person contractor, and it can prove its method on a pilot before anyone asks for a track record, which opens PPP work to new companies for the first time.

What it means for blockchain companies

Robots and sensors produce a steady stream of data on what was built, inspected and repaired. A blockchain company can record that data as it arrives, so performance payments, maintenance records and quality certificates rest on evidence every party can check, the way supply-chain certification already works on ledgers.

What will be built

Water networks	Robots and acoustic sensors that find leaks inside the network, in a country that still loses about 41% of its water to leaks, theft and faulty meters.
Construction	Modular methods, on-site automation and quality verification suited to Jordan's labor market.
Inspection	Drones and crawlers that survey roads, bridges, rail, power lines and pipelines and report defects automatically.
Energy	Robotic cleaning and maintenance for solar fields, and retrofit technology for public buildings, street lighting and water pumping.
Mining	Autonomous drilling, haulage and drone surveying for phosphate, potash and new mineral projects.
Ports and logistics	Automated handling, yard robotics and drone delivery for Aqaba's terminals and Jordan's dry ports and border crossings.

TOKENIZATION

Tokenization finances it and opens its ownership

A PPP absorbs capital over four years and releases it over thirty. Today's investors expect to enter and exit easily, and tokenization gives them that option.

What changes

A concession is a long-dated, contracted, inflation-linked cash flow, the kind of asset a token represents well and an ordinary investor has rarely been able to hold directly. Tokenization lets a small pilot be funded by a few hundred investors, with returns paid automatically from the asset's own revenue and no lender between them.

The rails already exist in the region. ADGM regulates tokenized securities, the Dubai Land Department records tokenized title deeds on its own register, and Jordan adopted a national Blockchain Technology Policy in December 2024. Tokenized concession revenues are still rare, so the first tokenized PPP in Jordan is open to whoever builds it.

PPP companies will be tokenized before PPP projects, because a developer already gathers projects, risks and revenues into one entity. People will own the builders first, then the portfolios, then the projects, and at the end of that sequence sits a stock exchange for the physical world.

What it means for blockchain companies

Tokenization is the core product. A blockchain company can issue tokenized stakes in PPP companies, portfolios and projects, onboard Jordanian and regional investors with identity checks built in, pay holders through smart contracts as tolls and tariffs arrive and run the secondary market where those stakes trade.

What will be built

Issuance	Compliant token issuance for PPP companies, infrastructure funds and small pilots.
Investor onboarding	Identity checks, suitability and custody built for Jordanian and regional investors.
Revenue distribution	Smart contracts that pay holders from tolls, tariffs and availability payments as the money arrives.
Registries	Shared records of contracts, milestones and asset performance that every party can trust.
Secondary markets	Venues where holders can buy and sell stakes in operating infrastructure.
Citizen participation	Tools for citizens to propose projects, vote them up and invest small amounts in what gets built.

SMALL PPPS IN PARALLEL

A thousand small PPPs teach more than one large one

The World Bank counted 315 private infrastructure projects reaching financial close across all low- and middle-income countries in 2024, only a few per country. No country can learn quickly at that pace, and each lesson arrives years after the technology behind it has moved on.

Each of those projects is too large, too slow and too expensive to try anything new on, and every approval, guarantee and stakeholder on a $1 billion project pulls it toward the way things were done before. Small projects are where a new idea can afford to be wrong, because the downside is small, the learning cycle is fast and the bureaucracy is thin.

Run them in parallel

Software has already moved from building one idea at a time to building ten at once, and infrastructure can follow. Picture 100 small schools built within six months, each delivered through its own PPP and each testing a slightly different legal structure, financing model, construction method and operating approach. Performance data arrives quickly, the models that work are copied, the weak ones are retired early and policy improves with every round, so a thousand small projects teach a country tens of thousands of lessons where one large project teaches a few.

$10M	spent preparing a single $100 million PPP, enough to build 100 pilots at $100,000 each
780	small PPPs a year in Jordan at $100,000 each, from 1% of the budgets of its 40 contracting authorities, about $78 million, in a country that closes only a handful of PPPs a year today
97,500	small PPPs a year if every country ran 500 at $100,000 each, for $9.75 billion, less than the price of one metro line

The PPP singularity

The PPP singularity is the point at which it becomes cheaper to build the pilot than to conduct the study. One feasibility study can make a project look feasible, another can make it look unfeasible, and the decision still comes down to judgment, while a pilot settles the argument with evidence. Governments that work this way become portfolio managers of experimentation: they set the objectives and the guardrails, standardize contracts that can adapt, collect the data and publish every pilot, every cost and every failure on one public website.

PPP RESEARCH LABS

Pilots need somewhere to live

PPP innovation needs the public and private sectors working together, so each lab is built the way a PPP is built: the public sector spearheads it and the private sector designs, finances, builds and operates it.

One lab per sector	Water, power, transport, aviation, health, education, agriculture, digital, tourism and urban development each get a lab inside the ministry or authority that runs the sector.
A one-line brief	Run ten small PPP projects a year at up to $100,000 each, testing new technologies, new PPP frameworks, new construction methods and new financing structures.
A PPP itself	The ministry tenders the lab, and private companies bid to design, finance, build and operate it with their own capital, effort and technology.
Funding	About $1 million a year per lab, found by moving 1% of an authority's budget away from inefficient spending. Ten labs can run a hundred experiments a year on a modest budget.
Open results	Every result is published as it happens, including the failures: what worked, what failed and what the contract should have said. The lessons go straight into the large PPPs already running and the ones still to come.
Room to explore	Labs carry no fixed deliverables, because predetermined outputs defeat the purpose of research, and they are judged on engineering results.

Who builds and who funds

Small projects open PPPs to founders and small companies. On a large concession a bid costs 3% to 5% of capex, prequalification asks for a decade of comparable projects and performance bonds run to tens of millions. AI cuts the bid cost, robotics cuts the crew a project needs and tokenization lets a few hundred investors fund a pilot, so a small PPP moves at the speed of the founders running it. Venture capital funds the technology, infrastructure funds finance the assets, and a $10 billion fund raised by both, deploying $2 billion in its first year, could back 20,000 small PPPs, about 100 in every country.

What it means for blockchain companies

Every small PPP is a chance to tokenize a real asset at low risk. A blockchain company can fund lab pilots from a few hundred investors, pay them from each asset's own revenue and publish every result on a ledger the public can read, which turns the labs into Jordan's first live market for tokenized infrastructure.

UNSOLICITED PROPOSALS

Jordanian law accepts unsolicited PPP proposals

Any private company can take its own PPP idea to government. Article 15 of PPP Law No. 19 of 2023 lets a proposer submit a direct proposal to the Ministry of Investment or a public authority, and PPP Regulation No. 9 of 2024 sets out how it is assessed.

How a direct proposal works

Conditions	The proposal offers an innovative solution for a public service, is prepared on the proposer's own initiative, gives value for money, fits government programs, covers the government's obligations from project revenues and discloses any conflict of interest.
Contents	The scope, the proposer and its experience, a pre-feasibility study with the innovation and intellectual property behind it, the fiscal implications and any support or guarantees sought, and the cost of preparing the study.
Review	A public authority or municipality that receives a proposal refers it to the Ministry, which has 60 days to take it up for study or return it unopened, and can charge a study fee of at least $7,050.
Registry	A qualifying proposal is listed as a PPP project in the national registry of public investment projects, and one that falls short is rejected.
Tender	If the project goes to tender, the proposer can match the best offer, and if another bidder wins, the winner repays the proposer's direct study costs.
Small projects	Projects with a capital cost below $14.1 million are small-scale PPPs, and similar ones can be bundled into one feasibility report and one tender under simpler procedures.

Limitless ideas

This is the Swiss Challenge approach: the proposer brings the idea, the market competes on it and the proposer keeps the right to match the best offer. Many of the projects in Jordan's $86 billion pipeline are still early enough for a partner to shape the deal or bring its own idea, and a direct proposal can be as large as a mini city built and operated under one contract or as small as a $100,000 pilot. The PPP research labs can be proposed the same way, and every company with an idea for a public service becomes a possible project sponsor.

What it means for blockchain companies

Article 15 asks for an innovative solution for a public service, and a tokenized financing structure or a public registry can be one. A direct proposal lets a blockchain company bring that solution to a ministry as a project of its own, protect the intellectual property behind it and keep the right to match the best offer at tender.

WHY BLOCKCHAIN COMPANIES

Blockchain companies open infrastructure to every investor

A PPP raises capital in large tickets and returns it over decades, which has kept its ownership with a few banks and funds. Blockchains give a concession a way to raise from many investors, pay them automatically and let them trade.

Where blockchain companies fit in a PPP

Preparation	Shared data rooms and registries that record each version of the studies, models and tender documents.
Tender	Bid records, digital guarantees and identity checks that every bidder and the contracting authority can verify.
Financial close	Tokenized notes and participations that bring retail and regional investors beside the banks and funds.
Operation	Smart contracts that pay holders from tolls, tariffs and availability payments, and ledgers that record asset performance.
Exit	Secondary markets where holders buy and sell stakes in operating infrastructure.

The market is already moving

As of October 8, 2026, $38.9 billion of tokenized real-world assets were held on public blockchains, excluding stablecoins, according to rwa.xyz, and infrastructure is still a small share of it. In September 2026, Maharashtra proposed income-share tokens on 40% to 50% of selected state transmission assets.

Why a program, and why now

The first tokenized PPP is still open to whoever builds it. A program gives a blockchain company a team, a product and the partners to deliver it, and the company that issues Jordan's first tokenized PPP will set the standard the next projects follow.

THE PROGRAM

How the program could work

The program can sit inside the company's product and partnerships teams, with a PPP lead at its center and offers built from the platform the company already runs.

PPP team	A small team of product, legal, compliance and finance people that covers every PPP in Jordan's pipeline from the first market sounding.
Issuance	Compliant issuance of tokenized notes and participations for PPP companies, project loans and small pilots, with regulated banks and venues as partners.
Investor onboarding	Identity checks, suitability and custody built for Jordanian and regional investors.
Registries	Shared records of contracts, milestones, payments and asset performance for governments, operators and lenders.
Direct proposals	Blockchain-led projects brought to government under Article 15 and prepared with partners who can finance and build them.
Pilots	Small-scale PPPs below $14.1 million that prove a tokenized structure on a live asset.
Partners	Agreements with banks, developers, operators, infrastructure funds and regulators across Jordan and the region.

What the company gains

The company gains fees for issuance, custody, registries and revenue distribution that last as long as the concessions they serve. Every project it tokenizes becomes a reference, a source of investors and a route into the next consortium, in Jordan and across the region.

It also gains a position at the start of a new market. The first company to tokenize a PPP in Jordan will set the standard for how operating infrastructure is owned, financed and traded, and its platform can carry that standard to the next project and the next country.

ABOUT

Jordan PPP

Accelerate Jordan
Accelerate the infrastructure singularity
Accelerate the Jordan PPP singularity

AMMAN, JORDAN WWW.JORDANPPP.COM

Jordan PPP helps every kind of organization in Jordan launch a public-private partnership (PPP) program of its own. It publishes 96 guides, one for each kind of organization, from the Royal Hashemite Court and Parliament to banks, contractors, universities, humanitarian organizations, companies in twenty-one sectors and organizations in twelve governorates.

Its vision is the infrastructure singularity, when roads, grids, ports and water networks become one globally connected, superintelligent computer, built by robotics, run by artificial intelligence and financed by tokenization. Rebuilding and running the world's infrastructure will take about $500 trillion over the next fifty years.

Its method starts small: a PPP program for every organization, small PPPs run in parallel, a research lab in each sector and direct proposals under Article 15 of PPP Law No. 19 of 2023, starting with Jordan's $86 billion and Aqaba's $46 billion of projects.

NEXT STEPS

How a blockchain company can start

Any blockchain company in Jordan can take this guide forward. The first steps use the platform, engineers and partners the company already has.

Mandate	Board approval for a PPP tokenization program, with its products, its sectors and its first-year goals.
Team	A named program lead, with product, legal, compliance and finance people drawn from the company's existing teams.
Pipeline	A map of Jordan's $86 billion of projects by sector and stage, and early meetings with the sponsors and lenders open to tokenized notes.
Products	Issuance, investor onboarding, registries and revenue distribution packaged into one PPP offer.
Partners	Regulated banks, venues, developers and regulators across Jordan and the region.
Pilot	A first tokenized pilot or blockchain-led direct proposal, taken from idea to submission.

Jordan has the projects, a national Blockchain Technology Policy and a law that lets a company propose its own projects. A PPP program puts your platform at the center of how the superintelligent infrastructure future is financed and owned.
