

A guide · The $500 trillion PPP infrastructure opportunity

Launch a PPP program for Defense and Security Institutions in Jordan

WHAT THIS GUIDE IS FOR

Your institution launches a PPP program to build, finance and maintain housing, hospitals, training estates, depots and the energy and water of its bases as public-private partnerships (PPPs), starting with Jordan's $86 billion and Aqaba's $46 billion of projects.

INTRODUCTION

A century of infrastructure reaches the end of its useful life

Most of the roads, bridges, power plants, water networks, ports and airports the world runs on were built in the last hundred years, and much of that stock is wearing out at the same time.

The infrastructure of the twentieth century was designed, poured and left to age. It carried the growth of every modern economy, and it was built for a world with fewer people, far less data and a different climate. Pipes leak, grids strain under new demand, and assets designed for one purpose are asked to carry several. Replacing them is the largest building program in human history, and it has already begun.

Rebuilding and running the world's infrastructure will take about $500 trillion over the next fifty years. It is the largest investment humanity will make in that time. Public-private partnerships (PPPs) will carry a large share of it, because governments cannot fund, build and run the rebuild alone, and the private sector cannot do it without them.

How the $500 trillion adds up

	$300T	to build the physical assets: roads, rail, ports, grids, water, cities, schools and hospitals
+	$150T	to operate and maintain them across the life of each concession
+	$50T	for the sensors, compute and robotics that will sit inside them, the share of the rebuild that venture capital can fund
=	$500T	**in total to rebuild and run the world's infrastructure over the next fifty years**

INTRODUCTION

The next hundred years will build Earth's largest computer

For thousands of years the method has stayed the same: design it, pour it, forget it, and repair it when it fails. The next generation of infrastructure will carry a software layer specified alongside the concrete. Assets will monitor their own condition, predict their own failures and schedule their own maintenance, and fleets of machines will raise them with very few human hands involved.

The larger change is the connection between assets. When a port knows what the rail line is carrying before it arrives, a water utility prices its pumping energy against the grid in real time, and every contract and drawing on every project sits in one connected record, the built world starts to behave as one system. Joined across borders, the world's roads, grids, ports, water networks, data centers and satellites become one globally connected, superintelligent computer.

Future infrastructure will be self-building, self-monitoring and self-healing. A road that senses its own cracks can schedule its own repair and use the savings to fund the next stretch. A water network that finds its own leaks can put the recovered water into meters on the next street. Each asset leaves behind the money, the data and the proof for the asset that follows it, so each new project starts further ahead than the last.

The point where the built world starts improving itself faster than anyone can direct it is the infrastructure singularity. Three technologies bring it closer: artificial intelligence designs and runs the assets, robotics builds and maintains them, and tokenization finances them and opens their ownership to everyone. Each of the three can improve the estate behind the service. AI plans maintenance across many sites, robots build and inspect buildings, and tokenization opens housing and hospital finance to many investors.

Housing, hospitals and bases have mostly been built with public budgets and maintained when funds allowed. The estates of the next fifty years will be built, financed and maintained by partners paid for availability and performance, and the institutions that set up those partnerships now will shape how their people live, train and heal for as long as the contracts last. This guide invites defense and security institutions in Jordan to launch a PPP program, starting with the projects at home.

THE GUIDE

Bring service estates to the $500 trillion PPP infrastructure opportunity

Your institution opens a dedicated PPP program, a team and a set of offers that deliver housing, hospitals, training estates and base utilities under availability contracts, starting with Jordan's $86 billion of projects and the $46 billion anchored in Aqaba.

01 **A PPP estates team.** A dedicated team that knows how PPPs are prepared, procured and financed follows every housing, health, energy and water project in Jordan's pipeline from the first market sounding and decides early where the institution's estate can benefit.

02 **Housing and hospitals.** Homes for service members and their families, hospitals and clinics can be financed, built and maintained by private partners under availability contracts, paid when each building is open and meets agreed standards.

03 **Energy, water and depots.** Bases, academies and depots can buy power, water and logistics services by performance, while partners finance and run the solar plants, water systems, warehouses and workshops behind them.

04 **Institution-led direct proposals.** Jordan's PPP Law No. 19 of 2023 accepts direct private proposals under Article 15. An institution can receive and invite proposals from companies for its civil estate, such as family housing, a solar plant for a base or a vehicle maintenance center, and review each one before it moves forward.

05 **Pilots as small-scale PPPs.** PPP Regulation No. 9 of 2024 defines small-scale PPPs below $14.1 million, which can be bundled into one feasibility report and one tender. A solar and water system for one base or a new clinic at that scale gives the institution a live contract and a reference.

JORDAN AND AQABA

An $86 billion pipeline to start with

Jordan has 243 PPP and infrastructure projects in development, worth about $86 billion, of which $46 billion is anchored in Aqaba. Many of them, from housing and hospitals to power and water, match the civil needs of defense estates.

$86 billion
of PPP and infrastructure projects in development across Jordan

$46 billion
anchored in Aqaba, Jordan's only port and its gateway to the Red Sea

SECTOR	PROJECTS	VALUE	WHAT THE PROJECTS WILL BUY
Energy	33	**$28.3 billion**	Grid and demand forecasting, solar and storage analytics, robotic panel cleaning, predictive maintenance
Tourism	40	**$13.8 billion**	Visitor flow and demand forecasting, resort and heritage-site operations, booking and payment rails
Urban development	17	**$13.8 billion**	Digital twins of new districts, digital permitting, modular construction, district operations
Transport	33	**$11.7 billion**	Traffic and fleet AI, tolling and payments, inspection drones for roads and rail
Industry	31	**$8.1 billion**	Factory automation, quality verification, industrial sensors and energy management
Water	29	**$7.6 billion**	Leak detection, pressure management, smart metering, pipe-inspection robots
Mining	15	**$1.2 billion**	Autonomous drilling and haulage, drone surveying, ore sorting
Health	12	**$1.0 billion**	Hospital operations AI, patient flow, equipment monitoring
Agriculture	10	**$310 million**	Precision irrigation, farm robotics, crop and soil monitoring
Environment	15	**$270 million**	Waste-sorting robotics, emissions monitoring, circular materials
Digital	6	**$270 million**	Data centers, connectivity, sovereign compute
Education	2	**$20 million**	School and training campus PPPs, digital learning, building operations and energy retrofits

A Jordanian institution that delivers one estate PPP at home can share the same model with partner institutions across the region. Aqaba concentrates ports and terminals, logistics, rail to the port, industry, energy, water and tourism inside the Aqaba Special Economic Zone, which makes it a single place to test port automation, logistics software, desalination and energy technology on assets that connect Jordan to the world.

SECTOR GUIDES

Jordan's $86 billion, sector by sector

Jordan is investing in and advancing 23 sectors at once, and together their projects make up the $86 billion. A sector guide for each lists every project in it, its link to the infrastructure singularity and the ways a partner can take part.

The sectors closest to defense and security institutions

Defense	Jordan Design and Development Bureau, owned by the armed forces; planned 400-bed Zarqa Military Hospital. 9 projects, $10m of forward investment. www.JordanPPP.com/sectors/defense
Manufacturing	Jordan Design and Development Bureau (formerly KADDB): armoured vehicles, drones. 38 projects, $2.4bn of forward investment. www.JordanPPP.com/sectors/manufacturing
Health	Royal Medical Services: King Hussein Medical City, five hospitals. 20 projects, $986m of forward investment. www.JordanPPP.com/sectors/health
Solar Power	100 MW solar plant for the Jordan Armed Forces in Aqaba (approved Jan 2025). 18 projects, $326m of forward investment. www.JordanPPP.com/sectors/solar
Education and Skills	Mutah University, public and military university with a military college. 12 projects, $7m of forward investment. www.JordanPPP.com/sectors/education

All 23 sector guides

Oil, Gas and Power	$15.1bn	Wastewater and Reuse	$946m
Tourism	$13.8bn	Nuclear Energy	$835m
Urban Development	$12.8bn	Agriculture and Food	$400m
Green Hydrogen	$10.6bn	Solar Power	$326m
Transport	$8.1bn	Digital and AI	$243m
Water	$6.7bn	Circular Economy	$189m
Fertilizers and Chemicals	$6.5bn	Wind Power	$186m
Ports and Logistics	$3.6bn	Pharmaceuticals	$128m
Manufacturing	$2.4bn	Creative Industries	$47m
Storage and Grids	$1.4bn	Defense	$10m
Mining and Minerals	$1.2bn	Education and Skills	$7m
Health	$986m		

Every sector guide can be read and downloaded at www.JordanPPP.com/sectors.

ARTIFICIAL INTELLIGENCE

AI designs, structures and runs it

A PPP takes about seven years from concept to financial close and costs roughly 10% of capex to structure. Almost all of that work is documents and models, which is the work AI does well.

What changes

When the cost of intelligence approaches zero, the cost of preparing a project falls with it. Feasibility studies, options appraisals, cost plans, risk matrices, financial models and tender documents can be produced and tested in days, and contracts can be drafted and stress-tested in hours. PPP projects will soon appoint an AI technical advisor alongside the human ones. Once an asset is running, the same intelligence operates it: a digital twin models the asset in real time, sensors report wear and faults early, and maintenance follows the data.

Jordan arrives late to PPP software, and that is an advantage. With few legacy systems to migrate off, AI-native tools can be built from the ground up, and the reasoning behind each decision can be captured inside the transactions being structured today.

What it means for defense and security institutions

AI can plan the upkeep of a large estate. It can track the condition of every building, vehicle and generator, forecast energy and water use at each base and schedule repairs before equipment fails. An institution can use those tools to hold its PPP partners to their performance standards and spend each budget where it matters most.

What will be built

Project preparation	Software that turns feasibility studies, cost plans and tender documents into a repeatable process, so the years spent before tender shrink to months.
Procurement	Tools that let ministries compare bids on whole-life cost and deliverability.
Cost estimation	A national benchmark database that prices every project against real Jordanian rates.
Contract intelligence	Assistants that read, compare and answer questions on every contract, drawing and instruction on a project in plain language.
Asset monitoring	Sensors and digital twins that tell an operator what will fail before it fails.
Permits and approvals	Digital workflows that replace the paper trail across ministries, municipalities and utilities.

ROBOTICS

Robots build it and keep it running

Most of the $500 trillion of infrastructure due over the next fifty years will be built by machines, and people will design, train and supervise those machines.

What changes

Autonomous software combined with autonomous machines produces autonomous infrastructure. Tunneling machines, construction robots, drones and modular factories already raise structures with far fewer people on site. The machines then stay with the asset: drones inspect bridges and power lines, robots travel inside pipes to find leaks, and cleaning robots keep solar fields at full output.

Robotics also changes who can compete. A small company with the right machines can build what once needed a thousand-person contractor, and it can prove its method on a pilot before anyone asks for a track record, which opens PPP work to new companies for the first time.

What it means for defense and security institutions

Robots can build housing faster, inspect roofs, tanks and pipes and keep warehouses running around the clock. An institution can ask its partners to bring those machines to its estates and workshops, and to train service members and young Jordanians as technicians who run and repair them.

What will be built

Water networks	Robots and acoustic sensors that find leaks inside the network, in a country that still loses about 41% of its water to leaks, theft and faulty meters.
Construction	Modular methods, on-site automation and quality verification suited to Jordan's labor market.
Inspection	Drones and crawlers that survey roads, bridges, rail, power lines and pipelines and report defects automatically.
Energy	Robotic cleaning and maintenance for solar fields, and retrofit technology for public buildings, street lighting and water pumping.
Mining	Autonomous drilling, haulage and drone surveying for phosphate, potash and new mineral projects.
Ports and logistics	Automated handling, yard robotics and drone delivery for Aqaba's terminals and Jordan's dry ports and border crossings.

TOKENIZATION

Tokenization finances it and opens its ownership

A PPP absorbs capital over four years and releases it over thirty. Today's investors expect to enter and exit easily, and tokenization gives them that option.

What changes

A concession is a long-dated, contracted, inflation-linked cash flow, the kind of asset a token represents well and an ordinary investor has rarely been able to hold directly. Tokenization lets a small pilot be funded by a few hundred investors, with returns paid automatically from the asset's own revenue and no lender between them.

The rails already exist in the region. ADGM regulates tokenized securities, the Dubai Land Department records tokenized title deeds on its own register, and Jordan adopted a national Blockchain Technology Policy in December 2024. Tokenized concession revenues are still rare, so the first tokenized PPP in Jordan is open to whoever builds it.

PPP companies will be tokenized before PPP projects, because a developer already gathers projects, risks and revenues into one entity. People will own the builders first, then the portfolios, then the projects, and at the end of that sequence sits a stock exchange for the physical world.

What it means for defense and security institutions

Tokenization can open estate finance to many investors. Stakes in a housing program, a clinic or a solar plant for a base can be offered as tokenized notes, paid from availability payments, so pension funds and citizens can invest in the homes and hospitals of those who serve.

What will be built

Issuance	Compliant token issuance for PPP companies, infrastructure funds and small pilots.
Investor onboarding	Identity checks, suitability and custody built for Jordanian and regional investors.
Revenue distribution	Smart contracts that pay holders from tolls, tariffs and availability payments as the money arrives.
Registries	Shared records of contracts, milestones and asset performance that every party can trust.
Secondary markets	Venues where holders can buy and sell stakes in operating infrastructure.
Citizen participation	Tools for citizens to propose projects, vote them up and invest small amounts in what gets built.

SMALL PPPS IN PARALLEL

A thousand small PPPs teach more than one large one

The World Bank counted 315 private infrastructure projects reaching financial close across all low- and middle-income countries in 2024, only a few per country. No country can learn quickly at that pace, and each lesson arrives years after the technology behind it has moved on.

Each of those projects is too large, too slow and too expensive to try anything new on, and every approval, guarantee and stakeholder on a $1 billion project pulls it toward the way things were done before. Small projects are where a new idea can afford to be wrong, because the downside is small, the learning cycle is fast and the bureaucracy is thin.

Run them in parallel

Software has already moved from building one idea at a time to building ten at once, and infrastructure can follow. Picture 100 small schools built within six months, each delivered through its own PPP and each testing a slightly different legal structure, financing model, construction method and operating approach. Performance data arrives quickly, the models that work are copied, the weak ones are retired early and policy improves with every round, so a thousand small projects teach a country tens of thousands of lessons where one large project teaches a few.

$10M	spent preparing a single $100 million PPP, enough to build 100 pilots at $100,000 each
780	small PPPs a year in Jordan at $100,000 each, from 1% of the budgets of its 40 contracting authorities, about $78 million, in a country that closes only a handful of PPPs a year today
97,500	small PPPs a year if every country ran 500 at $100,000 each, for $9.75 billion, less than the price of one metro line

The PPP singularity

The PPP singularity is the point at which it becomes cheaper to build the pilot than to conduct the study. One feasibility study can make a project look feasible, another can make it look unfeasible, and the decision still comes down to judgment, while a pilot settles the argument with evidence. Governments that work this way become portfolio managers of experimentation: they set the objectives and the guardrails, standardize contracts that can adapt, collect the data and publish every pilot, every cost and every failure on one public website.

PPP RESEARCH LABS

Pilots need somewhere to live

PPP innovation needs the public and private sectors working together, so each lab is built the way a PPP is built: the public sector spearheads it and the private sector designs, finances, builds and operates it.

One lab per sector	Water, power, transport, aviation, health, education, agriculture, digital, tourism and urban development each get a lab inside the ministry or authority that runs the sector.
A one-line brief	Run ten small PPP projects a year at up to $100,000 each, testing new technologies, new PPP frameworks, new construction methods and new financing structures.
A PPP itself	The ministry tenders the lab, and private companies bid to design, finance, build and operate it with their own capital, effort and technology.
Funding	About $1 million a year per lab, found by moving 1% of an authority's budget away from inefficient spending. Ten labs can run a hundred experiments a year on a modest budget.
Open results	Every result is published as it happens, including the failures: what worked, what failed and what the contract should have said. The lessons go straight into the large PPPs already running and the ones still to come.
Room to explore	Labs carry no fixed deliverables, because predetermined outputs defeat the purpose of research, and they are judged on engineering results.

Who builds and who funds

Small projects open PPPs to founders and small companies. On a large concession a bid costs 3% to 5% of capex, prequalification asks for a decade of comparable projects and performance bonds run to tens of millions. AI cuts the bid cost, robotics cuts the crew a project needs and tokenization lets a few hundred investors fund a pilot, so a small PPP moves at the speed of the founders running it. Venture capital funds the technology, infrastructure funds finance the assets, and a $10 billion fund raised by both, deploying $2 billion in its first year, could back 20,000 small PPPs, about 100 in every country.

What it means for defense and security institutions

Small PPPs let an institution prove a new model on one site at low cost. It can host a PPP research lab that trials robotic construction, AI maintenance and off-grid power at a base or academy, publish every result and carry the pilots that work to every estate.

UNSOLICITED PROPOSALS

Jordanian law accepts unsolicited PPP proposals

Any private company can take its own PPP idea to government. Article 15 of PPP Law No. 19 of 2023 lets a proposer submit a direct proposal to the Ministry of Investment or a public authority, and PPP Regulation No. 9 of 2024 sets out how it is assessed.

How a direct proposal works

Conditions	The proposal offers an innovative solution for a public service, is prepared on the proposer's own initiative, gives value for money, fits government programs, covers the government's obligations from project revenues and discloses any conflict of interest.
Contents	The scope, the proposer and its experience, a pre-feasibility study with the innovation and intellectual property behind it, the fiscal implications and any support or guarantees sought, and the cost of preparing the study.
Review	A public authority or municipality that receives a proposal refers it to the Ministry, which has 60 days to take it up for study or return it unopened, and can charge a study fee of at least $7,050.
Registry	A qualifying proposal is listed as a PPP project in the national registry of public investment projects, and one that falls short is rejected.
Tender	If the project goes to tender, the proposer can match the best offer, and if another bidder wins, the winner repays the proposer's direct study costs.
Small projects	Projects with a capital cost below $14.1 million are small-scale PPPs, and similar ones can be bundled into one feasibility report and one tender under simpler procedures.

Limitless ideas

This is the Swiss Challenge approach: the proposer brings the idea, the market competes on it and the proposer keeps the right to match the best offer. Many of the projects in Jordan's $86 billion pipeline are still early enough for a partner to shape the deal or bring its own idea, and a direct proposal can be as large as a mini city built and operated under one contract or as small as a $100,000 pilot. The PPP research labs can be proposed the same way, and every company with an idea for a public service becomes a possible project sponsor.

What it means for defense and security institutions

Direct proposals let companies bring housing, a solar plant or a maintenance center to an institution as a project of their own. The institution can invite them, review each one against its needs and keep the proposer's right to match the best offer at tender.

WHY DEFENSE AND SECURITY INSTITUTIONS

Defense and security institutions run large civil estates

Homes, hospitals, academies, depots and their utilities make up much of what an institution owns. Many countries deliver them through availability-payment PPPs, where a partner builds and maintains each asset and is paid when it performs to agreed standards.

Where institutions fit in a PPP

Preparation	Estate surveys and needs studies that set the scope of each housing, health or utility project.
Tender	Clear standards for security, access and service written into every bid and contract.
Financial close	Availability payments over long contracts that make estate projects bankable.
Operation	Maintenance, utilities and facility services kept to agreed standards for decades.
Exit	Assets returned to the institution in agreed condition, or refinanced by long-term funds.

Shared facilities serve everyone

Hospitals, training grounds, power plants and water systems built for an institution can also serve nearby towns and civil services. Shared facilities spread the cost across more users and bring better services to the governorates where many service members and their families live.

Why a program, and why now

Many countries have delivered service housing, hospitals and training estates through availability-payment PPPs for years, and Jordan now has a PPP law and a pipeline to do the same. A program gives an institution a team, a pipeline and the partners to act, and the first estate PPPs in Jordan will set the standard for the rest.

THE PROGRAM

How the program could work

The program can sit inside the institution's estates, engineering and finance directorates, with a PPP lead at its center and offers built from the land and facilities it holds.

PPP team	A small team of engineering, estates, legal and finance people that covers every relevant PPP in Jordan's pipeline.
Housing	Homes for service members and their families, built and maintained under availability contracts.
Health	Hospitals and clinics financed and maintained by partners, open to civil patients where agreed.
Utilities and depots	Solar power, water, warehouses and vehicle workshops run for bases by performance.
Direct proposals	Civil estate projects proposed under Article 15 and reviewed before they move forward.
Pilots	Small-scale PPPs below $14.1 million, such as a solar system for a base or a new clinic.
Partners	Agreements with developers, contractors, hospital operators, utilities, banks and infrastructure funds.

What the institution gains

The institution gains modern homes, hospitals and training estates delivered faster, maintained to agreed standards for decades and paid for over the life of each asset.

It also gains budget room and resilience. Partners who run energy, water and maintenance let the institution focus on its mission, while shared facilities bring better services to the towns around its estates.

ABOUT

Jordan PPP

Accelerate Jordan
Accelerate the infrastructure singularity
Accelerate the Jordan PPP singularity

AMMAN, JORDAN WWW.JORDANPPP.COM

Jordan PPP helps every kind of organization in Jordan launch a public-private partnership (PPP) program of its own. It publishes 96 guides, one for each kind of organization, from the Royal Hashemite Court and Parliament to banks, contractors, universities, humanitarian organizations, companies in twenty-one sectors and organizations in twelve governorates.

Its vision is the infrastructure singularity, when roads, grids, ports and water networks become one globally connected, superintelligent computer, built by robotics, run by artificial intelligence and financed by tokenization. Rebuilding and running the world's infrastructure will take about $500 trillion over the next fifty years.

Its method starts small: a PPP program for every organization, small PPPs run in parallel, a research lab in each sector and direct proposals under Article 15 of PPP Law No. 19 of 2023, starting with Jordan's $86 billion and Aqaba's $46 billion of projects.

NEXT STEPS

How a defense or security body can start

Any defense or security institution in Jordan can take this guide forward. The first steps use the land, facilities and partners it already has.

Mandate	Leadership approval for a PPP program, with its services, its estates and its first-year goals.
Team	A named program lead, with engineering, estates, legal and finance people drawn from the institution's existing directorates.
Pipeline	A map of Jordan's $86 billion of projects by sector and stage, and the housing, health and utility needs of the estate.
Estate	A survey of housing, hospitals, academies, depots and utilities, with the projects that suit a PPP.
Partners	Developers, contractors, hospital operators, utilities, banks and infrastructure funds.
Pilot	A first housing, clinic or base utility project, or a direct proposal invited from companies, taken from idea to submission.

Jordan has the projects, the engineers and a law that lets companies propose their own projects. A PPP program puts your institution at the center of how the superintelligent infrastructure future houses, heals and trains those who serve Jordan.
