

A guide · The $500 trillion PPP infrastructure opportunity

Launch a PPP program for Regional Development Authorities in Jordan

WHAT THIS GUIDE IS FOR

Your authority launches its own public-private partnership (PPP) program for the land, utilities, tourism and industrial estates of its region, with a lab for small PPPs and an open door to direct proposals, starting with Jordan's $86 billion and Aqaba's $46 billion of projects.

INTRODUCTION

A century of infrastructure reaches the end of its useful life

Most of the roads, bridges, power plants, water networks, ports and airports the world runs on were built in the last hundred years, and much of that stock is wearing out at the same time.

The infrastructure of the twentieth century was designed, poured and left to age. It carried the growth of every modern economy, and it was built for a world with fewer people, far less data and a different climate. Pipes leak, grids strain under new demand, and assets designed for one purpose are asked to carry several. Replacing them is the largest building program in human history, and it has already begun.

Rebuilding and running the world's infrastructure will take about $500 trillion over the next fifty years. It is the largest investment humanity will make in that time. Public-private partnerships (PPPs) will carry a large share of it, because governments cannot fund, build and run the rebuild alone, and the private sector cannot do it without them.

How the $500 trillion adds up

	$300T	to build the physical assets: roads, rail, ports, grids, water, cities, schools and hospitals
+	$150T	to operate and maintain them across the life of each concession
+	$50T	for the sensors, compute and robotics that will sit inside them, the share of the rebuild that venture capital can fund
=	$500T	**in total to rebuild and run the world's infrastructure over the next fifty years**

INTRODUCTION

The next hundred years will build Earth's largest computer

For thousands of years the method has stayed the same: design it, pour it, forget it, and repair it when it fails. The next generation of infrastructure will carry a software layer specified alongside the concrete. Assets will monitor their own condition, predict their own failures and schedule their own maintenance, and fleets of machines will raise them with very few human hands involved.

The larger change is the connection between assets. When a port knows what the rail line is carrying before it arrives, a water utility prices its pumping energy against the grid in real time, and every contract and drawing on every project sits in one connected record, the built world starts to behave as one system. Joined across borders, the world's roads, grids, ports, water networks, data centers and satellites become one globally connected, superintelligent computer.

Future infrastructure will be self-building, self-monitoring and self-healing. A road that senses its own cracks can schedule its own repair and use the savings to fund the next stretch. A water network that finds its own leaks can put the recovered water into meters on the next street. Each asset leaves behind the money, the data and the proof for the asset that follows it, so each new project starts further ahead than the last.

The point where the built world starts improving itself faster than anyone can direct it is the infrastructure singularity. Three technologies bring it closer: artificial intelligence designs and runs the assets, robotics builds and maintains them, and tokenization finances them and opens their ownership to everyone. Each of the three suits a region, where one authority plans the land, licenses the projects and supervises the services under one set of rules.

A region grows when its land is serviced, its utilities are reliable and its investors can get an answer in one place. Regional development authorities hold the master plan, the land and the licenses for their territory, so the way they prepare projects sets the pace for everything built inside it. This guide invites regional development authorities in Jordan to launch a PPP program of their own, starting with the projects at home.

THE GUIDE

Build the $500 trillion PPP infrastructure opportunity into Jordan's regions

Your authority launches a dedicated PPP program, with a PPP unit, a master plan of projects that private partners can finance, build and operate, a lab for small PPPs and an open door to direct proposals, starting with Jordan's $86 billion of projects and the $46 billion anchored in Aqaba.

01 **A PPP unit inside the authority.** A small dedicated team that knows how PPPs are prepared, procured and supervised turns the region's master plan into projects that private partners can finance, build and operate, and it follows each one from the first market sounding to the end of the concession.

02 **The master plan as a pipeline.** The authority marks which roads, utilities, visitor services, housing and industrial estates in its master plan private partners will deliver, and it offers each one with serviced land, licenses and a clear output specification.

03 **Utilities, tourism and estates as PPPs.** Water, wastewater, waste, power and telecom networks, visitor centers, transport inside heritage sites, hotels on public land and ready-built industrial estates can each be tendered as a PPP, with a partner paid for the service it delivers.

04 **An open door to direct proposals.** Article 15 of PPP Law No. 19 of 2023 lets a company bring its own PPP idea to a public authority, and PPP Regulation No. 9 of 2024 sets out how it is assessed. The authority publishes what its region needs and studies the ideas that answer them on their merits.

05 **A regional lab and small PPPs.** The authority tenders a PPP research lab that runs small pilots inside its territory, and PPP Regulation No. 9 of 2024 defines small-scale PPPs below $14.1 million, which can be bundled into one feasibility report and one tender under simpler procedures.

JORDAN AND AQABA

An $86 billion pipeline to start with

Jordan has 243 PPP and infrastructure projects in development, worth about $86 billion, of which $46 billion is anchored in Aqaba. Many of them sit inside a region that a single authority plans, licenses and supervises for decades.

$86 billion
of PPP and infrastructure projects in development across Jordan

$46 billion
anchored in Aqaba, Jordan's only port and its gateway to the Red Sea

SECTOR	PROJECTS	VALUE	WHAT THE PROJECTS WILL BUY
Energy	33	**$28.3 billion**	Grid and demand forecasting, solar and storage analytics, robotic panel cleaning, predictive maintenance
Tourism	40	**$13.8 billion**	Visitor flow and demand forecasting, resort and heritage-site operations, booking and payment rails
Urban development	17	**$13.8 billion**	Digital twins of new districts, digital permitting, modular construction, district operations
Transport	33	**$11.7 billion**	Traffic and fleet AI, tolling and payments, inspection drones for roads and rail
Industry	31	**$8.1 billion**	Factory automation, quality verification, industrial sensors and energy management
Water	29	**$7.6 billion**	Leak detection, pressure management, smart metering, pipe-inspection robots
Mining	15	**$1.2 billion**	Autonomous drilling and haulage, drone surveying, ore sorting
Health	12	**$1.0 billion**	Hospital operations AI, patient flow, equipment monitoring
Agriculture	10	**$310 million**	Precision irrigation, farm robotics, crop and soil monitoring
Environment	15	**$270 million**	Waste-sorting robotics, emissions monitoring, circular materials
Digital	6	**$270 million**	Data centers, connectivity, sovereign compute
Education	2	**$20 million**	School and training campus PPPs, digital learning, building operations and energy retrofits

An authority that proves a model on one project in its region can repeat it across its whole territory. Aqaba concentrates ports and terminals, logistics, rail to the port, industry, energy, water and tourism inside the Aqaba Special Economic Zone, which makes it a single place to test port automation, logistics software, desalination and energy technology on assets that connect Jordan to the world.

SECTOR GUIDES

Jordan's $86 billion, sector by sector

Jordan is investing in and advancing 23 sectors at once, and together their projects make up the $86 billion. A sector guide for each lists every project in it, its link to the infrastructure singularity and the ways a partner can take part.

The sectors closest to regional development authorities

Tourism	ASEZA (Aqaba tourism, Wadi Rum) and Petra Development and Tourism Region Authority. 56 projects, $13.8bn of forward investment. www.JordanPPP.com/sectors/tourism
Ports and Logistics	ASEZA / Aqaba Development Corporation: port, airport and multimodal transport. 23 projects, $3.6bn of forward investment. www.JordanPPP.com/sectors/logistics
Manufacturing	Development zones (Zarqa, Queen Alia Airport, Sahab, Karak) and ASEZA industry. 38 projects, $2.4bn of forward investment. www.JordanPPP.com/sectors/manufacturing
Water	Jordan Valley Authority: water supply and dams in the Jordan Valley. 29 projects, $6.7bn of forward investment. www.JordanPPP.com/sectors/water
Agriculture and Food	Jordan Valley Authority: agricultural land development. 28 projects, $400m of forward investment. www.JordanPPP.com/sectors/agriculture

All 23 sector guides

Oil, Gas and Power	$15.1bn	Wastewater and Reuse	$946m
Tourism	$13.8bn	Nuclear Energy	$835m
Urban Development	$12.8bn	Agriculture and Food	$400m
Green Hydrogen	$10.6bn	Solar Power	$326m
Transport	$8.1bn	Digital and AI	$243m
Water	$6.7bn	Circular Economy	$189m
Fertilizers and Chemicals	$6.5bn	Wind Power	$186m
Ports and Logistics	$3.6bn	Pharmaceuticals	$128m
Manufacturing	$2.4bn	Creative Industries	$47m
Storage and Grids	$1.4bn	Defense	$10m
Mining and Minerals	$1.2bn	Education and Skills	$7m
Health	$986m		

Every sector guide can be read and downloaded at www.JordanPPP.com/sectors.

ARTIFICIAL INTELLIGENCE

AI designs, structures and runs it

A PPP takes about seven years from concept to financial close and costs roughly 10% of capex to structure. Almost all of that work is documents and models, which is the work AI does well.

What changes

When the cost of intelligence approaches zero, the cost of preparing a project falls with it. Feasibility studies, options appraisals, cost plans, risk matrices, financial models and tender documents can be produced and tested in days, and contracts can be drafted and stress-tested in hours. PPP projects will soon appoint an AI technical advisor alongside the human ones. Once an asset is running, the same intelligence operates it: a digital twin models the asset in real time, sensors report wear and faults early, and maintenance follows the data.

Jordan arrives late to PPP software, and that is an advantage. With few legacy systems to migrate off, AI-native tools can be built from the ground up, and the reasoning behind each decision can be captured inside the transactions being structured today.

What it means for regional development authorities

AI lets a regional authority plan and run its territory as one system. A digital twin of the region joins land use, utilities, visitor flows and traffic, so each PPP is sized to forecast demand and priced on evidence. A small PPP unit can also draft output specifications, compare bids on whole-life cost and read every contract in its region in plain language.

What will be built

Project preparation	Software that turns feasibility studies, cost plans and tender documents into a repeatable process, so the years spent before tender shrink to months.
Procurement	Tools that let ministries compare bids on whole-life cost and deliverability.
Cost estimation	A national benchmark database that prices every project against real Jordanian rates.
Contract intelligence	Assistants that read, compare and answer questions on every contract, drawing and instruction on a project in plain language.
Asset monitoring	Sensors and digital twins that tell an operator what will fail before it fails.
Permits and approvals	Digital workflows that replace the paper trail across ministries, municipalities and utilities.

ROBOTICS

Robots build it and keep it running

Most of the $500 trillion of infrastructure due over the next fifty years will be built by machines, and people will design, train and supervise those machines.

What changes

Autonomous software combined with autonomous machines produces autonomous infrastructure. Tunneling machines, construction robots, drones and modular factories already raise structures with far fewer people on site. The machines then stay with the asset: drones inspect bridges and power lines, robots travel inside pipes to find leaks, and cleaning robots keep solar fields at full output.

Robotics also changes who can compete. A small company with the right machines can build what once needed a thousand-person contractor, and it can prove its method on a pilot before anyone asks for a track record, which opens PPP work to new companies for the first time.

What it means for regional development authorities

Robotics changes what a regional authority can ask for in a tender. Output specifications can require drone surveys of land and heritage sites, robotic inspection of pipes and roads and automated records of maintenance, so performance is measured by machines and reported as data. A region that writes these requirements in receives assets that cost less to supervise.

What will be built

Water networks	Robots and acoustic sensors that find leaks inside the network, in a country that still loses about 41% of its water to leaks, theft and faulty meters.
Construction	Modular methods, on-site automation and quality verification suited to Jordan's labor market.
Inspection	Drones and crawlers that survey roads, bridges, rail, power lines and pipelines and report defects automatically.
Energy	Robotic cleaning and maintenance for solar fields, and retrofit technology for public buildings, street lighting and water pumping.
Mining	Autonomous drilling, haulage and drone surveying for phosphate, potash and new mineral projects.
Ports and logistics	Automated handling, yard robotics and drone delivery for Aqaba's terminals and Jordan's dry ports and border crossings.

TOKENIZATION

Tokenization finances it and opens its ownership

A PPP absorbs capital over four years and releases it over thirty. Today's investors expect to enter and exit easily, and tokenization gives them that option.

What changes

A concession is a long-dated, contracted, inflation-linked cash flow, the kind of asset a token represents well and an ordinary investor has rarely been able to hold directly. Tokenization lets a small pilot be funded by a few hundred investors, with returns paid automatically from the asset's own revenue and no lender between them.

The rails already exist in the region. ADGM regulates tokenized securities, the Dubai Land Department records tokenized title deeds on its own register, and Jordan adopted a national Blockchain Technology Policy in December 2024. Tokenized concession revenues are still rare, so the first tokenized PPP in Jordan is open to whoever builds it.

PPP companies will be tokenized before PPP projects, because a developer already gathers projects, risks and revenues into one entity. People will own the builders first, then the portfolios, then the projects, and at the end of that sequence sits a stock exchange for the physical world.

What it means for regional development authorities

Tokenization lets the people of a region own part of what is built there. A utility, a visitor center or an industrial estate can raise part of its capital from a few hundred local and regional investors and pay them from its own revenue, and a public registry can record each contract, milestone and payment for everyone to see.

What will be built

Issuance	Compliant token issuance for PPP companies, infrastructure funds and small pilots.
Investor onboarding	Identity checks, suitability and custody built for Jordanian and regional investors.
Revenue distribution	Smart contracts that pay holders from tolls, tariffs and availability payments as the money arrives.
Registries	Shared records of contracts, milestones and asset performance that every party can trust.
Secondary markets	Venues where holders can buy and sell stakes in operating infrastructure.
Citizen participation	Tools for citizens to propose projects, vote them up and invest small amounts in what gets built.

SMALL PPPS IN PARALLEL

A thousand small PPPs teach more than one large one

The World Bank counted 315 private infrastructure projects reaching financial close across all low- and middle-income countries in 2024, only a few per country. No country can learn quickly at that pace, and each lesson arrives years after the technology behind it has moved on.

Each of those projects is too large, too slow and too expensive to try anything new on, and every approval, guarantee and stakeholder on a $1 billion project pulls it toward the way things were done before. Small projects are where a new idea can afford to be wrong, because the downside is small, the learning cycle is fast and the bureaucracy is thin.

Run them in parallel

Software has already moved from building one idea at a time to building ten at once, and infrastructure can follow. Picture 100 small schools built within six months, each delivered through its own PPP and each testing a slightly different legal structure, financing model, construction method and operating approach. Performance data arrives quickly, the models that work are copied, the weak ones are retired early and policy improves with every round, so a thousand small projects teach a country tens of thousands of lessons where one large project teaches a few.

$10M	spent preparing a single $100 million PPP, enough to build 100 pilots at $100,000 each
780	small PPPs a year in Jordan at $100,000 each, from 1% of the budgets of its 40 contracting authorities, about $78 million, in a country that closes only a handful of PPPs a year today
97,500	small PPPs a year if every country ran 500 at $100,000 each, for $9.75 billion, less than the price of one metro line

The PPP singularity

The PPP singularity is the point at which it becomes cheaper to build the pilot than to conduct the study. One feasibility study can make a project look feasible, another can make it look unfeasible, and the decision still comes down to judgment, while a pilot settles the argument with evidence. Governments that work this way become portfolio managers of experimentation: they set the objectives and the guardrails, standardize contracts that can adapt, collect the data and publish every pilot, every cost and every failure on one public website.

PPP RESEARCH LABS

Pilots need somewhere to live

PPP innovation needs the public and private sectors working together, so each lab is built the way a PPP is built: the public sector spearheads it and the private sector designs, finances, builds and operates it.

One lab per sector	Water, power, transport, aviation, health, education, agriculture, digital, tourism and urban development each get a lab inside the ministry or authority that runs the sector.
A one-line brief	Run ten small PPP projects a year at up to $100,000 each, testing new technologies, new PPP frameworks, new construction methods and new financing structures.
A PPP itself	The ministry tenders the lab, and private companies bid to design, finance, build and operate it with their own capital, effort and technology.
Funding	About $1 million a year per lab, found by moving 1% of an authority's budget away from inefficient spending. Ten labs can run a hundred experiments a year on a modest budget.
Open results	Every result is published as it happens, including the failures: what worked, what failed and what the contract should have said. The lessons go straight into the large PPPs already running and the ones still to come.
Room to explore	Labs carry no fixed deliverables, because predetermined outputs defeat the purpose of research, and they are judged on engineering results.

Who builds and who funds

Small projects open PPPs to founders and small companies. On a large concession a bid costs 3% to 5% of capex, prequalification asks for a decade of comparable projects and performance bonds run to tens of millions. AI cuts the bid cost, robotics cuts the crew a project needs and tokenization lets a few hundred investors fund a pilot, so a small PPP moves at the speed of the founders running it. Venture capital funds the technology, infrastructure funds finance the assets, and a $10 billion fund raised by both, deploying $2 billion in its first year, could back 20,000 small PPPs, about 100 in every country.

What it means for regional development authorities

A regional authority suits a PPP research lab, because it holds land, licenses and services in one territory. It can tender its own lab, pilot smart utilities, visitor services or robotic inspection on its own sites, collect the data from each pilot and carry what works into the large projects, while every published failure teaches the other regions too.

UNSOLICITED PROPOSALS

Jordanian law accepts unsolicited PPP proposals

Any private company can take its own PPP idea to government. Article 15 of PPP Law No. 19 of 2023 lets a proposer submit a direct proposal to the Ministry of Investment or a public authority, and PPP Regulation No. 9 of 2024 sets out how it is assessed.

How a direct proposal works

Conditions	The proposal offers an innovative solution for a public service, is prepared on the proposer's own initiative, gives value for money, fits government programs, covers the government's obligations from project revenues and discloses any conflict of interest.
Contents	The scope, the proposer and its experience, a pre-feasibility study with the innovation and intellectual property behind it, the fiscal implications and any support or guarantees sought, and the cost of preparing the study.
Review	A public authority or municipality that receives a proposal refers it to the Ministry, which has 60 days to take it up for study or return it unopened, and can charge a study fee of at least $7,050.
Registry	A qualifying proposal is listed as a PPP project in the national registry of public investment projects, and one that falls short is rejected.
Tender	If the project goes to tender, the proposer can match the best offer, and if another bidder wins, the winner repays the proposer's direct study costs.
Small projects	Projects with a capital cost below $14.1 million are small-scale PPPs, and similar ones can be bundled into one feasibility report and one tender under simpler procedures.

Limitless ideas

This is the Swiss Challenge approach: the proposer brings the idea, the market competes on it and the proposer keeps the right to match the best offer. Many of the projects in Jordan's $86 billion pipeline are still early enough for a partner to shape the deal or bring its own idea, and a direct proposal can be as large as a mini city built and operated under one contract or as small as a $100,000 pilot. The PPP research labs can be proposed the same way, and every company with an idea for a public service becomes a possible project sponsor.

What it means for regional development authorities

Direct proposals bring a regional authority ideas from companies that know its land and its visitors, prepared at their own cost. The Ministry of Investment can charge the proposer a study fee for each review, and a qualifying proposal is listed in the national registry of public investment projects, while the tender still tests the idea against the market: the proposer can match the best offer, and the winning bidder pays the proposer's direct study costs.

WHY REGIONAL DEVELOPMENT AUTHORITIES

Regional authorities hold the plan, the land and the licenses

A PPP needs a defined need, land to build on, licenses to proceed and a public partner that stays for decades. A regional development authority holds all four inside its territory, which makes it one of the fastest places in Jordan to prepare a project and supervise it on live data.

Where regional authorities fit in a PPP

Master plan	Land use, zoning and phasing that decide which projects the region needs and where they go.
Land	Serviced public land that a partner can lease for a utility, a visitor service or an industrial estate.
Licensing	Permits and approvals through one authority, which set how quickly a partner can build.
Tender	Prequalification, bid evaluation and negotiation with the consortiums that compete for the contract.
Supervision	Measurement of service levels across the region and payment to each partner for its results.

Jordan already runs its regions this way

The Aqaba Special Economic Zone Authority was created by Law No. 32 of 2000 and is run by a six-member Board of Commissioners, with its own regulations for zoning, land and the development of Wadi Rum. The Petra Development and Tourism Region Authority was created by Law No. 15 of 2009, the Jordan Valley Authority has led the valley's development since 1977, and the Investment Environment Law No. 21 of 2022 places the development zones under the Ministry of Investment.

Why a program, and why now

Without a program, each PPP in a region is a one-off and the authority relearns the process every time. A program gives it a team, standard documents, a lab that tests new ideas on its own land and a clear route for proposals. The regions that prepare their projects now will host the largest share of the $86 billion of projects in development.

THE PROGRAM

How the program could work

The program can sit inside the authority's planning and investment departments, with a PPP unit at its center and the master plan, land and licenses the authority already holds behind it.

PPP unit	A small team of planning, technical, legal, financial and procurement staff that prepares, tenders and supervises the region's PPPs.
Master plan	A phased plan that marks which roads, utilities, visitor services and estates private partners will deliver.
Utilities	Water, wastewater, waste, power and telecom networks delivered as PPPs, with long-term prices offered to users.
Tourism and estates	Visitor centers, site transport, hotels on public land and ready-built industrial estates developed with private partners.
Smart region	A digital twin of the region, with sensors, drones and robotic inspection written into every contract.
Lab and proposals	A research lab tendered as a PPP, a clear route for proposals under Article 15 and small-scale PPPs below $14.1 million bundled into one tender.
Partners	Working links with ministries, municipalities, lenders, universities, investors and the companies that bid.

What the authority gains

The authority gains infrastructure ahead of demand without carrying all of the capital itself, partners who share the risk of each phase and investors who receive one clear answer. Each project adds standard documents, data and staff who know how to run the next one, and each pilot in the lab shows what works before the large projects commit to it.

It also gains a place at the front of how regions grow. The first authorities in the region to run on a digital twin, welcome direct proposals and prepare their projects for AI, robotics and tokenization will set the standard that other regions follow.

ABOUT

Jordan PPP

Accelerate Jordan
Accelerate the infrastructure singularity
Accelerate the Jordan PPP singularity

AMMAN, JORDAN WWW.JORDANPPP.COM

Jordan PPP helps every kind of organization in Jordan launch a public-private partnership (PPP) program of its own. It publishes 96 guides, one for each kind of organization, from the Royal Hashemite Court and Parliament to banks, contractors, universities, humanitarian organizations, companies in twenty-one sectors and organizations in twelve governorates.

Its vision is the infrastructure singularity, when roads, grids, ports and water networks become one globally connected, superintelligent computer, built by robotics, run by artificial intelligence and financed by tokenization. Rebuilding and running the world's infrastructure will take about $500 trillion over the next fifty years.

Its method starts small: a PPP program for every organization, small PPPs run in parallel, a research lab in each sector and direct proposals under Article 15 of PPP Law No. 19 of 2023, starting with Jordan's $86 billion and Aqaba's $46 billion of projects.

NEXT STEPS

How a regional authority can start

Any regional development authority in Jordan can take this guide forward. The first steps use the master plan, land, licenses and staff the authority already has.

Mandate	A decision by the board to launch a PPP program, with its sectors, its first projects and its first-year goals.
Team	A named program lead, with planning, technical, legal, financial and procurement staff drawn from existing departments.
Pipeline	A list of the region's planned projects by stage, set beside Jordan's $86 billion of projects to find the ones inside its territory.
Land	A register of public plots and corridors that suit PPPs, with their zoning, services and licensing status.
Partners	Ministries, municipalities, lenders, investors and the companies that will bid for the lab and propose new projects.
Pilot	A first small-scale PPP or direct proposal in the region, taken from idea to tender.

Jordan has the projects, authorities that plan and license whole regions and a law that accepts unsolicited proposals. A PPP program gives your authority the team, the lab and the pipeline to grow its region at the pace of its investors and to lead the superintelligent infrastructure future from the public side.
