

A guide · The $500 trillion PPP infrastructure opportunity

Launch a PPP program for Schools in Jordan

WHAT THIS GUIDE IS FOR

Your school launches a PPP program that runs its campus energy, water and transport with private partners, teaches its students how infrastructure is built with AI, robotics and tokenization, and takes part in new school projects, starting with Jordan's $86 billion and Aqaba's $46 billion of projects.

INTRODUCTION

A century of infrastructure reaches the end of its useful life

Most of the roads, bridges, power plants, water networks, ports and airports the world runs on were built in the last hundred years, and much of that stock is wearing out at the same time.

The infrastructure of the twentieth century was designed, poured and left to age. It carried the growth of every modern economy, and it was built for a world with fewer people, far less data and a different climate. Pipes leak, grids strain under new demand, and assets designed for one purpose are asked to carry several. Replacing them is the largest building program in human history, and it has already begun.

Rebuilding and running the world's infrastructure will take about $500 trillion over the next fifty years. It is the largest investment humanity will make in that time. Public-private partnerships (PPPs) will carry a large share of it, because governments cannot fund, build and run the rebuild alone, and the private sector cannot do it without them.

How the $500 trillion adds up

	$300T	to build the physical assets: roads, rail, ports, grids, water, cities, schools and hospitals
+	$150T	to operate and maintain them across the life of each concession
+	$50T	for the sensors, compute and robotics that will sit inside them, the share of the rebuild that venture capital can fund
=	$500T	**in total to rebuild and run the world's infrastructure over the next fifty years**

INTRODUCTION

The next hundred years will build Earth's largest computer

For thousands of years the method has stayed the same: design it, pour it, forget it, and repair it when it fails. The next generation of infrastructure will carry a software layer specified alongside the concrete. Assets will monitor their own condition, predict their own failures and schedule their own maintenance, and fleets of machines will raise them with very few human hands involved.

The larger change is the connection between assets. When a port knows what the rail line is carrying before it arrives, a water utility prices its pumping energy against the grid in real time, and every contract and drawing on every project sits in one connected record, the built world starts to behave as one system. Joined across borders, the world's roads, grids, ports, water networks, data centers and satellites become one globally connected, superintelligent computer.

Future infrastructure will be self-building, self-monitoring and self-healing. A road that senses its own cracks can schedule its own repair and use the savings to fund the next stretch. A water network that finds its own leaks can put the recovered water into meters on the next street. Each asset leaves behind the money, the data and the proof for the asset that follows it, so each new project starts further ahead than the last.

The point where the built world starts improving itself faster than anyone can direct it is the infrastructure singularity. Three technologies bring it closer: artificial intelligence designs and runs the assets, robotics builds and maintains them, and tokenization finances them and opens their ownership to everyone. Each of the three will shape the jobs, the cities and the classrooms of the students in school today.

The engineers, operators and investors of the next fifty years are in school today, and the buildings they learn in are themselves infrastructure: roofs that can carry solar panels, water systems, buses and networks that run every day of the school year. This guide invites schools in Jordan to launch a PPP program that improves their own campus with private partners and prepares their students for the projects at home.

THE GUIDE

Run, teach and build the infrastructure of learning

Your school opens a dedicated PPP program, with a small team, campus projects delivered with private partners and classes that use them, that prepares its students and its buildings for Jordan's $86 billion of projects and the $46 billion anchored in Aqaba.

01 **Campus assets with partners.** Solar on the roofs, water saving, building upkeep and school transport can each be delivered by a private partner that invests, operates and is paid from the savings or a service fee, on PPP terms the school agrees once.

02 **The campus as a classroom.** Every asset the school runs with a partner becomes a lesson: students read the meters, follow the costs, track the savings and see how a contract shares risk between a school and a company.

03 **AI, robotics and tokenization in class.** Clubs and courses let students build sensors, program small robots, test AI on real campus data and learn how an asset can be owned and financed by many small investors.

04 **New schools and new places.** Schools that operate well can take part in PPPs that build and run new school buildings, nurseries and sports and learning facilities, as operators or as partners in a consortium.

05 **Direct proposals.** Jordan's PPP Law No. 19 of 2023 accepts direct private proposals under Article 15, and PPP Regulation No. 9 of 2024 defines small-scale PPPs below $14.1 million, which can be bundled into one feasibility report and one tender, so a school group with a good idea for a community facility has a legal route to a contract.

JORDAN AND AQABA

An $86 billion pipeline to start with

Jordan has 243 PPP and infrastructure projects in development, worth about $86 billion, of which $46 billion is anchored in Aqaba. Every one of them will need trained people, and many of them will serve the families whose children attend school.

$86 billion
of PPP and infrastructure projects in development across Jordan

$46 billion
anchored in Aqaba, Jordan's only port and its gateway to the Red Sea

SECTOR	PROJECTS	VALUE	WHAT THE PROJECTS WILL BUY
Energy	33	$28.3 billion	Grid and demand forecasting, solar and storage analytics, robotic panel cleaning, predictive maintenance
Tourism	40	$13.8 billion	Visitor flow and demand forecasting, resort and heritage-site operations, booking and payment rails
Urban development	17	$13.8 billion	Digital twins of new districts, digital permitting, modular construction, district operations
Transport	33	$11.7 billion	Traffic and fleet AI, tolling and payments, inspection drones for roads and rail
Industry	31	$8.1 billion	Factory automation, quality verification, industrial sensors and energy management
Water	29	$7.6 billion	Leak detection, pressure management, smart metering, pipe-inspection robots
Mining	15	$1.2 billion	Autonomous drilling and haulage, drone surveying, ore sorting
Health	12	$1.0 billion	Hospital operations AI, patient flow, equipment monitoring
Agriculture	10	$310 million	Precision irrigation, farm robotics, crop and soil monitoring
Environment	15	$270 million	Waste-sorting robotics, emissions monitoring, circular materials
Digital	6	$270 million	Data centers, connectivity, sovereign compute
Education	2	$20 million	School and training campus PPPs, digital learning, building operations and energy retrofits

A Jordanian school group that runs one campus project well with a partner can repeat it across its campuses and offer it to others. Aqaba concentrates ports and terminals, logistics, rail to the port, industry, energy, water and tourism inside the Aqaba Special Economic Zone, which makes it a single place to test port automation, logistics software, desalination and energy technology on assets that connect Jordan to the world.

SECTOR GUIDES

Jordan's $86 billion, sector by sector

Jordan is investing in and advancing 23 sectors at once, and together their projects make up the $86 billion. A sector guide for each lists every project in it, its link to the infrastructure singularity and the ways a partner can take part.

The sectors closest to schools

Education and Skills	Ministry of Education pilot PPP for 15 public schools, part of a plan for up to 600 schools. 12 projects, $7m of forward investment. www.JordanPPP.com/sectors/education
Transport	Jordan's first PPP national school transport project serves public school students. 32 projects, $8.1bn of forward investment. www.JordanPPP.com/sectors/transport
Solar Power	Energy and Education ministers opened a 26 kW solar system at Arjan High School in Ajloun, under a Canadian grant covering 128 schools. 18 projects, $326m of forward investment. www.JordanPPP.com/sectors/solar
Water	GIZ's Improved Learning Environment project plans rainwater harvesting at 20 pilot public schools, with the Ministry of Education. 29 projects, $6.7bn of forward investment. www.JordanPPP.com/sectors/water
Digital and AI	The Ministry of Education and Mawdoo3 signed an agreement to develop and maintain Darsak, the online learning platform for school students. 19 projects, $243m of forward investment. www.JordanPPP.com/sectors/digital

All 23 sector guides

Oil, Gas and Power	$15.1bn	Wastewater and Reuse	$946m
Tourism	$13.8bn	Nuclear Energy	$835m
Urban Development	$12.8bn	Agriculture and Food	$400m
Green Hydrogen	$10.6bn	Solar Power	$326m
Transport	$8.1bn	Digital and AI	$243m
Water	$6.7bn	Circular Economy	$189m
Fertilizers and Chemicals	$6.5bn	Wind Power	$186m
Ports and Logistics	$3.6bn	Pharmaceuticals	$128m
Manufacturing	$2.4bn	Creative Industries	$47m
Storage and Grids	$1.4bn	Defense	$10m
Mining and Minerals	$1.2bn	Education and Skills	$7m
Health	$986m		

Every sector guide can be read and downloaded at www.JordanPPP.com/sectors.

ARTIFICIAL INTELLIGENCE

AI designs, structures and runs it

A PPP takes about seven years from concept to financial close and costs roughly 10% of capex to structure. Almost all of that work is documents and models, which is the work AI does well.

What changes

When the cost of intelligence approaches zero, the cost of preparing a project falls with it. Feasibility studies, options appraisals, cost plans, risk matrices, financial models and tender documents can be produced and tested in days, and contracts can be drafted and stress-tested in hours. PPP projects will soon appoint an AI technical advisor alongside the human ones. Once an asset is running, the same intelligence operates it: a digital twin models the asset in real time, sensors report wear and faults early, and maintenance follows the data.

Jordan arrives late to PPP software, and that is an advantage. With few legacy systems to migrate off, AI-native tools can be built from the ground up, and the reasoning behind each decision can be captured inside the transactions being structured today.

What it means for schools

AI gives a school a way to run its campus on data and to teach with it. Meters and sensors on energy, water and buildings feed simple models that spot waste and plan maintenance, and students can study the same data in class. A school that learns to work with AI on its own buildings is ready to partner on larger facilities.

What will be built

Project preparation	Software that turns feasibility studies, cost plans and tender documents into a repeatable process, so the years spent before tender shrink to months.
Procurement	Tools that let ministries compare bids on whole-life cost and deliverability.
Cost estimation	A national benchmark database that prices every project against real Jordanian rates.
Contract intelligence	Assistants that read, compare and answer questions on every contract, drawing and instruction on a project in plain language.
Asset monitoring	Sensors and digital twins that tell an operator what will fail before it fails.
Permits and approvals	Digital workflows that replace the paper trail across ministries, municipalities and utilities.

ROBOTICS

Robots build it and keep it running

Most of the $500 trillion of infrastructure due over the next fifty years will be built by machines, and people will design, train and supervise those machines.

What changes

Autonomous software combined with autonomous machines produces autonomous infrastructure. Tunneling machines, construction robots, drones and modular factories already raise structures with far fewer people on site. The machines then stay with the asset: drones inspect bridges and power lines, robots travel inside pipes to find leaks, and cleaning robots keep solar fields at full output.

Robotics also changes who can compete. A small company with the right machines can build what once needed a thousand-person contractor, and it can prove its method on a pilot before anyone asks for a track record, which opens PPP work to new companies for the first time.

What it means for schools

Robotics turns the campus into a workshop. Solar-cleaning machines, inspection drones and small maintenance robots can keep school assets running, and students who build and program robots in clubs and classes learn the skills the construction and operation of infrastructure will need.

What will be built

Water networks	Robots and acoustic sensors that find leaks inside the network, in a country that still loses about 41% of its water to leaks, theft and faulty meters.
Construction	Modular methods, on-site automation and quality verification suited to Jordan's labor market.
Inspection	Drones and crawlers that survey roads, bridges, rail, power lines and pipelines and report defects automatically.
Energy	Robotic cleaning and maintenance for solar fields, and retrofit technology for public buildings, street lighting and water pumping.
Mining	Autonomous drilling, haulage and drone surveying for phosphate, potash and new mineral projects.
Ports and logistics	Automated handling, yard robotics and drone delivery for Aqaba's terminals and Jordan's dry ports and border crossings.

TOKENIZATION

Tokenization finances it and opens its ownership

A PPP absorbs capital over four years and releases it over thirty. Today's investors expect to enter and exit easily, and tokenization gives them that option.

What changes

A concession is a long-dated, contracted, inflation-linked cash flow, the kind of asset a token represents well and an ordinary investor has rarely been able to hold directly. Tokenization lets a small pilot be funded by a few hundred investors, with returns paid automatically from the asset's own revenue and no lender between them.

The rails already exist in the region. ADGM regulates tokenized securities, the Dubai Land Department records tokenized title deeds on its own register, and Jordan adopted a national Blockchain Technology Policy in December 2024. Tokenized concession revenues are still rare, so the first tokenized PPP in Jordan is open to whoever builds it.

PPP companies will be tokenized before PPP projects, because a developer already gathers projects, risks and revenues into one entity. People will own the builders first, then the portfolios, then the projects, and at the end of that sequence sits a stock exchange for the physical world.

What it means for schools

Tokenization lets a campus project be financed by a community. A solar roof or a water system can be funded by parents, alumni and local investors who each hold a small share and are paid from the asset's own savings, and students can follow every step as a lesson in finance and law.

What will be built

Issuance	Compliant token issuance for PPP companies, infrastructure funds and small pilots.
Investor onboarding	Identity checks, suitability and custody built for Jordanian and regional investors.
Revenue distribution	Smart contracts that pay holders from tolls, tariffs and availability payments as the money arrives.
Registries	Shared records of contracts, milestones and asset performance that every party can trust.
Secondary markets	Venues where holders can buy and sell stakes in operating infrastructure.
Citizen participation	Tools for citizens to propose projects, vote them up and invest small amounts in what gets built.

SMALL PPPS IN PARALLEL

A thousand small PPPs teach more than one large one

The World Bank counted 315 private infrastructure projects reaching financial close across all low- and middle-income countries in 2024, only a few per country. No country can learn quickly at that pace, and each lesson arrives years after the technology behind it has moved on.

Each of those projects is too large, too slow and too expensive to try anything new on, and every approval, guarantee and stakeholder on a $1 billion project pulls it toward the way things were done before. Small projects are where a new idea can afford to be wrong, because the downside is small, the learning cycle is fast and the bureaucracy is thin.

Run them in parallel

Software has already moved from building one idea at a time to building ten at once, and infrastructure can follow. Picture 100 small schools built within six months, each delivered through its own PPP and each testing a slightly different legal structure, financing model, construction method and operating approach. Performance data arrives quickly, the models that work are copied, the weak ones are retired early and policy improves with every round, so a thousand small projects teach a country tens of thousands of lessons where one large project teaches a few.

$10M	spent preparing a single $100 million PPP, enough to build 100 pilots at $100,000 each
780	small PPPs a year in Jordan at $100,000 each, from 1% of the budgets of its 40 contracting authorities, about $78 million, in a country that closes only a handful of PPPs a year today
97,500	small PPPs a year if every country ran 500 at $100,000 each, for $9.75 billion, less than the price of one metro line

The PPP singularity

The PPP singularity is the point at which it becomes cheaper to build the pilot than to conduct the study. One feasibility study can make a project look feasible, another can make it look unfeasible, and the decision still comes down to judgment, while a pilot settles the argument with evidence. Governments that work this way become portfolio managers of experimentation: they set the objectives and the guardrails, standardize contracts that can adapt, collect the data and publish every pilot, every cost and every failure on one public website.

PPP RESEARCH LABS

Pilots need somewhere to live

PPP innovation needs the public and private sectors working together, so each lab is built the way a PPP is built: the public sector spearheads it and the private sector designs, finances, builds and operates it.

One lab per sector	Water, power, transport, aviation, health, education, agriculture, digital, tourism and urban development each get a lab inside the ministry or authority that runs the sector.
A one-line brief	Run ten small PPP projects a year at up to $100,000 each, testing new technologies, new PPP frameworks, new construction methods and new financing structures.
A PPP itself	The ministry tenders the lab, and private companies bid to design, finance, build and operate it with their own capital, effort and technology.
Funding	About $1 million a year per lab, found by moving 1% of an authority's budget away from inefficient spending. Ten labs can run a hundred experiments a year on a modest budget.
Open results	Every result is published as it happens, including the failures: what worked, what failed and what the contract should have said. The lessons go straight into the large PPPs already running and the ones still to come.
Room to explore	Labs carry no fixed deliverables, because predetermined outputs defeat the purpose of research, and they are judged on engineering results.

Who builds and who funds

Small projects open PPPs to founders and small companies. On a large concession a bid costs 3% to 5% of capex, prequalification asks for a decade of comparable projects and performance bonds run to tens of millions. AI cuts the bid cost, robotics cuts the crew a project needs and tokenization lets a few hundred investors fund a pilot, so a small PPP moves at the speed of the founders running it. Venture capital funds the technology, infrastructure funds finance the assets, and a $10 billion fund raised by both, deploying $2 billion in its first year, could back 20,000 small PPPs, about 100 in every country.

What it means for schools

A school is a natural home for small PPPs. Its roofs, water systems and transport are ready-made pilots that a partner can improve and measure within a school year, and every result can be shared with other schools and taught in class.

UNSOLICITED PROPOSALS

Jordanian law accepts unsolicited PPP proposals

Any private company can take its own PPP idea to government. Article 15 of PPP Law No. 19 of 2023 lets a proposer submit a direct proposal to the Ministry of Investment or a public authority, and PPP Regulation No. 9 of 2024 sets out how it is assessed.

How a direct proposal works

Conditions	The proposal offers an innovative solution for a public service, is prepared on the proposer's own initiative, gives value for money, fits government programs, covers the government's obligations from project revenues and discloses any conflict of interest.
Contents	The scope, the proposer and its experience, a pre-feasibility study with the innovation and intellectual property behind it, the fiscal implications and any support or guarantees sought, and the cost of preparing the study.
Review	A public authority or municipality that receives a proposal refers it to the Ministry, which has 60 days to take it up for study or return it unopened, and can charge a study fee of at least $7,050.
Registry	A qualifying proposal is listed as a PPP project in the national registry of public investment projects, and one that falls short is rejected.
Tender	If the project goes to tender, the proposer can match the best offer, and if another bidder wins, the winner repays the proposer's direct study costs.
Small projects	Projects with a capital cost below $14.1 million are small-scale PPPs, and similar ones can be bundled into one feasibility report and one tender under simpler procedures.

Limitless ideas

This is the Swiss Challenge approach: the proposer brings the idea, the market competes on it and the proposer keeps the right to match the best offer. Many of the projects in Jordan's $86 billion pipeline are still early enough for a partner to shape the deal or bring its own idea, and a direct proposal can be as large as a mini city built and operated under one contract or as small as a $100,000 pilot. The PPP research labs can be proposed the same way, and every company with an idea for a public service becomes a possible project sponsor.

What it means for schools

A school group can bring a community facility to government as a direct proposal with a private partner, such as a shared sports hall, a learning center or a solar project for nearby public buildings, with its own campus and experience behind it.

WHY SCHOOLS

Schools run real infrastructure and raise the people who will run the rest

A school campus is a working set of assets that serves a community every day, and a school is trusted by the families around it. Those two things make schools natural partners for small PPPs and natural places to prepare the next generation of infrastructure professionals.

Where schools fit in a PPP

Campus assets	Energy, water, buildings, networks and transport that a private partner can finance, operate and maintain on agreed terms.
Operators	School groups that can run new school buildings and learning facilities delivered as PPPs.
Communities	Parents, alumni and local businesses who can take part in financing small campus projects.
Teaching	Classes, clubs and competitions that use live projects to teach engineering, computing, finance and law.
Talent	Students who leave school ready for the engineering, technology and finance careers that PPPs create.

What changes on a campus

AI, robotics and tokenization change how a campus can be run and paid for. Sensors and AI show where energy and water are lost, robots keep panels and buildings in order, and tokenized notes let a community fund a project and share its savings. A school that adopts them with a private partner lowers its running costs, and its students learn from the equipment around them.

Why a program, and why now

Without a program, each campus improvement is a one-off purchase, and the school pays for it in full before it saves anything. A program sets one way of working with private partners, so each project can be financed and operated by the partner and paid from its results, and each one becomes part of what students learn. Jordan's pipeline is large and early, and the schools that start now will train the first students who grew up with PPPs around them.

THE PROGRAM

How the program could work

The program can run from the school's management with a small team, a list of campus projects and partners from industry and government.

PPP team	A named lead with the school's finance and facilities staff and a teacher who links each project to the classroom.
Campus projects	A list of assets ready for a partner, such as solar, water saving, building upkeep and transport, each with its data and its targets.
Partner terms	One set of PPP terms for campus projects, so each partner invests, operates and is paid from savings or a service fee in the same way.
Classroom	Lessons, clubs and competitions that use the live projects to teach engineering, computing, finance and law.
Community finance	A small pilot that lets parents, alumni and local investors fund a campus asset and share in its savings.
New facilities	A route to take part in PPPs for new school buildings and learning facilities, alone or in a consortium.
Partners	Agreements with energy, water, technology and facility companies, banks and the authorities that procure school projects.

What the school gains

The school gains lower running costs paid for by partners, a campus that teaches, and a reputation with families as a place that prepares students for the work ahead. Each project it completes adds data, lessons and partners that make the next one easier.

It also gains a role in the projects around it. Schools that know how to work with private partners can operate new facilities and bring community projects forward, which puts them at the start of the decades of building ahead in Jordan.

ABOUT

Jordan PPP

Accelerate Jordan
Accelerate the infrastructure singularity
Accelerate the Jordan PPP singularity

AMMAN, JORDAN WWW.JORDANPPP.COM

Jordan PPP helps every kind of organization in Jordan launch a public-private partnership (PPP) program of its own. It publishes 96 guides, one for each kind of organization, from the Royal Hashemite Court and Parliament to banks, contractors, universities, humanitarian organizations, companies in twenty-one sectors and organizations in twelve governorates.

Its vision is the infrastructure singularity, when roads, grids, ports and water networks become one globally connected, superintelligent computer, built by robotics, run by artificial intelligence and financed by tokenization. Rebuilding and running the world's infrastructure will take about $500 trillion over the next fifty years.

Its method starts small: a PPP program for every organization, small PPPs run in parallel, a research lab in each sector and direct proposals under Article 15 of PPP Law No. 19 of 2023, starting with Jordan's $86 billion and Aqaba's $46 billion of projects.

JORDAN PPP

What Jordan PPP offers

The guides

One for every organization

96 guides, each with the case, the program and six first steps.

www.jordanppp.com/guides →

The summary

All guides in one document

Every guide, its organization and its ask, in one place.

www.jordanppp.com/summary →

Futureproofing

AI, robotics, tokenization

What the three technologies change for every organization.

www.jordanppp.com/futureproofing →

The opportunity

$500 trillion

The $500 trillion PPP infrastructure opportunity, from the crisis to the exchanges.

NEXT STEPS

How a school can start

Any school in Jordan can take this guide forward. The first steps use the campus, the staff and the students the school already has.

Mandate	Board or owner approval for a PPP program, with its first campus projects and its first-year goals.
Team	A named lead, with the school's finance and facilities staff and a teacher for the classroom side.
Campus map	A list of the school's energy, water, building and transport assets, with their costs and data.
Classroom	A first course or club that follows a campus project from contract to results.
Partners	Energy, water, technology and facility companies, and a bank, that can finance and run the first projects.
Pilot	A first campus project or small-scale PPP, taken from idea to signed partner.

Jordan has the projects, the schools and a law that accepts unsolicited proposals. A PPP program lets your school run a better campus with partners and prepare the students who will build the superintelligent infrastructure future, starting with Jordan's $86 billion and Aqaba's $46 billion of projects.
